SUMMARY

I am a frontend engineer with hands-on experience in building multi-application Angular platforms from the ground up. Currently architecting the frontend for a multi-tenant SaaS platform serving five standalone applications across four user roles, and contributing across a six-app Angular monorepo for an HR and recruitment SaaS product. I am passionate about clean, reusable component architecture and building interfaces that are genuinely easy to use. Comfortable working across Angular and React, integrating REST APIs, and collaborating closely with backend and design teams to ship features end-to-end.

SKILLS

Angular (Standalone Components, Signals) · React · TypeScript · JavaScript · HTML & CSS · RxJS · REST API Integration · TailwindCSS · Angular Material · Git & GitHub · Docker (basic) · Unit Testing (Vitest)

WORK EXPERIENCE

Frontend Engineer — SIDD

September 2025 – Present

I built the frontend for a multi-tenant SaaS platform that digitises workplace cafeteria operations for corporate organisations. Own the frontend architecture, delivering five separate Angular applications from a single monorepo, serving four distinct user roles.

- Designed and maintained an Angular monorepo housing five standalone applications: Super Admin, Admin (Organisation), Vendor App, Staff App, and a shared Auth Library.
- Built a shared authentication library consumed across all apps, covering login, registration, password reset, OTP verification, and account activation, eliminating duplicated auth code platform-wide.
- Built the Super Admin dashboard for managing organisations, vendors, users, admins & roles, billing/revenue, and vendor payouts, with route-level lazy loading and role-based access guards.
- Developed the Organisation Admin dashboard, spanning cafeteria management, meal & subsidy configuration (fixed/percentage/full-cover modes), vendor CRUD, staff management with bulk CSV import, an eligibility rules engine, and a full Direct Debit payment lifecycle (bank lookup, mandate setup, OTP-gated confirmation, bulk batch payments with partial-success handling).
- Built the Vendor Portal for food vendors to manage menus, orders, payouts, and account settings, with JWT-based auth and route guards.
- Delivered a Staff App for booking meals, checkout, and QR-code-based meal collection using real-time camera scanning (jsqr).
- Integrated ApexCharts for dashboard analytics, GSAP for UI animations, and implemented JWT decode/refresh flows for secure sessions.
- Used RxJS extensively for reactive HTTP pipelines and async state handling; styled with TailwindCSS, Angular Material, and NG-Zorro Antd.
- Wrote unit tests with Vitest and managed multi-environment configs (dev/staging/production) across all five apps.

Built a role-based delivery logistics management web application (Door-to-Door Delivery Management) enabling end-to-end visibility and control over card/parcel delivery workflows for financial institutions.

- Engineered a multi-module Angular SPA (standalone components) for managing the full lifecycle of card and parcel deliveries across institutions, vendors, and riders.
- Built a real-time analytics dashboard displaying key delivery KPIs (Total Requests, Pending Pickup, In-Transit, Delivered, Failed) with dynamic filtering by institution, date range, and status.

- Developed a Batch Management module supporting CSV/XLSX bulk order uploads with client-side validation, drag-and-drop interface, institution-scoped upload, and paginated batch listing with export.
- Implemented role-based routing and access control (Admin, Vendor Admin, Customer Service, Institution Admin) using Angular route guards, with automatic redirects based on signed-in user roles.
- Created an Order Tracking feature with a visual timeline drawer (Request Initiated → Picked Up → In Transit → Delivered), fetching real-time status per order via REST API.
- Built lazy-loaded feature modules for Vendor, Institution, Branch, User, Card Product, and Rider Management, each independently routed for performance.
- Integrated order rescheduling with a confirmation modal flow, date-based eligibility logic, and success/failure feedback.
- Implemented data export (XLSX/CSV) across multiple modules with dynamic filename generation based on active filters.
- Consumed a custom SSO Angular library for authentication and JWT-based session management.
- Used Angular Signals for reactive state management across services (orders, batches, institutions, loading states).
- Containerised the application with Docker and configured Nginx as a reverse proxy for production deployment.

Frontend Engineer (Contract) — **Karos Cloud**

January 2024 – August 2025

Contributed across a multi-app Angular SaaS platform comprising six independent products, covering HR, recruitment, project management, document collaboration, analytics, and learning & development, built from a single Nx monorepo.

- Contributed to the Career Center module, including the recruitment admin dashboard (job postings, applicant tracking, hiring manager assignments) and the LMS module for internal employee upskilling.
- Worked on cross-app functionality including authentication flows (OAuth 2.0 / JWT) and real-time cross-tab communication using the BroadcastChannel API.
- Contributed to rich content features, including integration of the Tiptap editor for collaborative document editing and export workflows (docx, PDF).
- Worked within a strict TypeScript codebase, writing unit tests with Vitest and E2E tests with Playwright.
- Used Angular Signals for reactive state management and TailwindCSS for styling across the platform.

EDUCATION

Federal University Otuoke — B.Sc. Entrepreneurship (November 2019 – October 2023)

CERTIFICATION

Virtual Assistant Program — ALX
